

Theme 2: Coal seam gas extraction

Index No.	Paper No.	Paper Title	Authors	Affiliation
33	040	Quantification of adsorbed methane capacity of coals by using NMR relaxation spectroscopy: Possibilities and limitations	Y Yao and D Liu	China University of Geosciences, China
34	054	Surface subsidence mechanism induced by coal seam gas extraction and parametric analysis	S Jia and B Wu	CSIRO, Australia
35	058	The far-field deformation from a hydraulic fracture in a coal seam in an elastically stiffer half space	Z Chen, V Pandurangan and R Jeffrey	CSIRO, Australia
36	066	Coal capillary-pressure measurement using low-field NMR and the calculation of relative permeability	X Sun, Y Yao and D Liu	China University of Geosciences, China
37	080	A model for quantitative description on the evolution of coal permeability under loading and loading-unloading stress condition	J Xie, M Gao, R Zhang, Z Zhang and G Li	Sichuan University, China
38	087	Analysis on CBM migration under the control of the geological structures	Y Liu, L Zhang, D Wang and S Fan	China Coal Research Institute, China
39	119	Up-scaling of fluid flow and permeability in cleat networks	J Busse, SA Galindo Torres, D Bringemeier, L Li and A Scheuermann	Geotechnical Engineering Centre, School of Civil Engineering, Australia
40	206	Experimental Study of Effect of Compaction Creep on Unsaturated Coal and Permeability of Coal Containing Gas	NN Danesh, Z Chen, Z Pan, LD Connoll, SM Aminossadati and MS Kizil	University of Queensland, Australia

Theme 2: Coal seam gas extraction

41	212	Upscaling constitutive relationship for coal matrix for numerical simulation of permeability changes in coalbed methane reservoirs	S Harpalani and S Saurabh	Southern Illinois University, USA
42	214	A numerical insight into large-scale coal failure during gas production	M Lu and L Connell	CSIRO, Australia
43	257	Coupled thermo-chemical-mechanical-modelling of underground coal gasification cavity growth	N Andrianopoulos, A Korre, S Durucan, G Si, J Shi and S Franzsen	Imperial College, London
